

Documentation Outline: *Suicidal Rate Analysis*

1. Project Overview

- Purpose: To analyze global suicide data across demographics, countries, and time.
- Tools Used: Excel (dashboard creation), dataset preprocessing.
- Objective: Identify patterns and trends in suicide rates to support awareness and policy discussions.

2. Dataset Description

- Source: Kaggle
- Variables included:
 - Year
 - Country
 - Age group
 - Gender
 - Generation
 - GDP per capita

3. Methodology

- Data cleaning: Removed duplicates, handled missing values.
- Aggregation: Grouped data by age, gender, generation, and country.
- Visualization: Created charts (line graphs, pie charts, bar charts) to highlight trends.

4. Dashboard Components

- **Suicide Rate by Years** → Line chart showing yearly trends.
- **Suicide by Age Group** → Bar chart showing distribution across age categories.
- **Suicide by Gender** → Pie chart comparing male vs female rates.
- **Suicide by Generation** → Bar chart showing generational differences.
- **Suicide Rate by Country** → Bar chart ranking countries.
- **GDP per Capita vs Suicide Rate** → Comparative analysis of economic factors.

5. Key Insights

- Higher suicide rates observed in certain countries (e.g., Russia, Lithuania).

- Males consistently show higher suicide rates compared to females.
- Middle-aged groups (35–54, 55–74) have the highest suicide counts.
- Boomers and Silent Generation show significant suicide numbers compared to younger generations.
- GDP per capita does not directly correlate with lower suicide rates — some wealthy countries still show high rates.

6. Conclusion

- Suicide is influenced by multiple demographic and socio-economic factors.
- Awareness campaigns and targeted interventions should focus on high-risk groups (middle-aged, certain countries).
- Further research could explore cultural, healthcare, and policy impacts.
